REC'D 23 JAN 2004

WIPO PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the forms you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

COMPOUNDS AND PROCESS

The present invention concerns a process for the preparation of pyrimidines and intermediate compounds useful in the preparation thereof.

According to a first aspect of the present invention, there is provided a process for the preparation of a compound of Formula (1):

Formula (1)

which comprises

a) reacting a compound of formula R¹-CO-CH₂-E with a compound of formula R²-CHX¹X² in the presence of a compound of formula R³R⁴N-C(=NH)NH₂ and a catalyst, thereby to form a dihydropyrimidine; and

b) oxidising the dihydropyrimidine produced in step a) to form the compound of Formula (1) wherein

R¹ is H or an alkyl group;

R² is H or an alkyl or aryl group;

R³ and R⁴ are each independently H, alkyl, aryl, a group of formula R⁵SO₂-, wherein R⁵ is alkyl or aryl, or R³ and R⁴ are linked to form, together with the nitrogen to which they are attached to form a 5 to 7 membered heterocyclic ring;

E is an electron withdrawing group; and

X¹ and X² are each independently leaving groups, or X¹ and X² together represent =O.

Dihydropyrimidines formed in step a) can be represented by the Formula (2):

Formula (2)

It will be recognised that the compounds of Formula (2) can exist in a number of tautomeric forms in which the double bonds are delocalised into other positions in the molecule, notably into different positions around the pyrimidine ring.

5 Alkyl groups which may be represented by R^1 include linear, branched and cyclic alkyl groups commonly comprising from 1 to 8 carbon atoms. Preferred cyclic alkyl groups include cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl groups. Preferred linear and branched alkyl groups include methyl, ethyl, n-propyl, isopropyl, n-butyl, sec-butyl and tert-butyl groups. Most preferably, R^1 represents isopropyl.

Alkyl groups which may be represented by R^2 are as described above for R^1 .

10 Aryl groups which may be represented by R^2 include both homoaryl and heteroaryl groups, and commonly comprise at least one 5 to 7 membered aromatic ring. Examples of aryl groups include phenyl, naphthyl and pyridyl groups. Most preferably, R^2 represents a phenyl group.

15 Alkyl and aryl groups which may be represented by R^3 , R^4 and R^5 are as described above for R^1 and R^2 . When one of R^3 or R^4 represents a group of formula R^5SO_2 , it is preferably a mesyl or tosyl group. In certain preferred embodiments, R^3 represents methyl and R^4 represents mesyl. In other preferred embodiments, either or both of R^3 and R^4 are H.

20 Alkyl and aryl groups which may be represented by R^1 , R^2 , R^3 , R^4 and R^5 may be unsubstituted or substituted by one or more substituents. Examples of substituents include optionally substituted alkoxy (preferably C_{1-4} -alkoxy), optionally substituted alkyl (preferably C_{1-4} -alkyl), optionally substituted aryl (preferably phenyl), optionally substituted aryloxy (preferably phenoxy), optionally substituted heterocyclyl, polyalkylene oxide (preferably polyethylene oxide or polypropylene oxide), carboxy, phosphato, sulpho, nitro, 25 cyano, halo, especially chloro and fluoro, ureido, $-SO_2F$, hydroxy, ester, $-NR^aR^b$, $-COR^a$, $-CONR^aR^b$, $-NHCOR^a$, carboxyester, sulphone, and $-SO_2NR^aR^b$ wherein R^a and R^b are each independently H, optionally substituted alkyl (especially C_{1-4} -alkyl) or optionally substituted aryl (preferably phenyl), or, in the case of $-NR^aR^b$, $-CONR^aR^b$ and $-SO_2NR^aR^b$, R^a and R^b together with the nitrogen atom to which they are attached may represent an 30 aliphatic or aromatic ring system. Optional substituents for any of the substituents described may be selected from the same list of substituents.

Electron withdrawing groups which may be represented by E include nitro groups; nitrile groups; perhaloalkyl groups, such as trifluoromethyl and pentafluoroethyl; ester groups, especially alkyl carboxylate groups; sulphonamide groups; keto groups; amide 35 groups; and aldehyde groups.

E may also represent a group of formula $-CHX^aX^b$, wherein X^a and X^b each independently represents a halo, especially a chloro or bromo group, an alkoxy group, especially a C_{1-4} alkoxy, such as a methoxy or ethoxy group, an alkylthio group, especially a C_{1-4} alkylthio group, or X^a and X^b are linked to form a cyclic acetal or thioacetal

commonly comprising, with the carbon to which X^a and X^b are bonded, from 5 to 7 atoms in the ring. When E represents a group of formula $-CHX^aX^b$, it is preferred that X^a is the same as X^b .

Further groups which may be represented by E are groups of formula $-CH_2E^2$, wherein E^2 represents halo, especially bromo or chloro, or a phosphorus-containing moiety, such as a phosphate ester, for example of formula $-OP(=O)(OR^a)_2$, a phosphonate ester, for example of formula $-P(=O)(OR^a)_2$, a phosphite ester, for example of formula $-P(OR^a)_2$, a phosphine, for example of formula $-P(R^c)_2$, or a phosphine oxide, for example of formula $-P(=O)(R^c)_2$ in each of which R^c represents an alkyl, such as a C_{1-4} alkyl, or an aryl, such as a phenyl, group. When E^2 represents a phosphorus-containing moiety, it is preferably a phosphonate ester of formula $-P(=O)(OR^d)_2$ wherein R^d represents methyl, ethyl or phenyl.

E may also represent a group of formula $-CR^x=CR^yR^z$, wherein R^x , R^y and R^z each independently represent H, alkyl or aryl. Preferably, R^x and R^y represent H, and R^z represents an optionally substituted C_{1-6} alkyl chain. R^z is preferably substituted by two hydroxy groups, commonly present as a protected 1,3-dihydroxy moiety. R^z preferably comprises a terminal carboxyl group, especially a carboxy ester group. R^z is most preferably a group of formula:

wherein R^1 is an alkyl group, preferably a tert-butyl group.

A particular compound of formula $R^1-CO-CH_2-E$ is of formula:

wherein R^1 is an alkyl group, preferably a tert-butyl group.

Preferably, E represents a group of formula $-CO_2(C_{1-4}alkyl)$, and especially $-CO_2Me$.

Leaving groups which can be represented by X^1 and X^2 include chloro, bromo and iodo, especially chloro, groups, and alkoxy groups, especially C_{1-4} alkoxy, such as methoxy, groups. Commonly when X^1 and X^2 are leaving groups, either both are selected

from chloro, bromo or iodo, or both are alkoxy. It is most preferred that X^1 and X^2 together represent =O.

In certain aspects of the present invention, in place of the compound of formula $R^1\text{-CO-CH}_2\text{-E}$, a compound of formula $R^1\text{-CO-CH=CH-N(R}^9\text{)}_2$ is employed, wherein R^1 is as previously defined, and each R^9 independently is an alkyl, preferably a C_{1-4} alkyl, group, an aryl group, preferably a phenyl group, or the moiety $N(R^9)_2$ represents a 5 to 7 membered heterocyclic group, such as a pyrrolidine, piperidine or morpholine group.

Oxidising agents which may be employed in the process according to the present invention include those oxidising agents known in the art to oxidise dihydropyrimidines to pyrimidines. Examples of suitable oxidising agents include quinones, particularly substituted benzoquinones such as 2,3-dichloro-5,6-dicyano-1,4-benzoquinone; transition metal oxidants such as ceric ammonium nitrate or sulfate, barium manganate, cadmium chloride and manganese dioxide; metallic oxidants, such as palladium on charcoal or other suitable platinum group metals; elemental sulfur; oxygen, especially atmospheric oxygen; and nitrosylsulfuric acid.

Preferred compounds of formula $R^1\text{-CO-CH}_2\text{-E}$ are compounds of formula $(C_{1-4}\text{alkyl})\text{-CO-CH}_2\text{CO}_2R^8$, wherein R^8 represents a C_{1-4} alkyl group, especially a methyl group. Most preferred compounds of formula $R^1\text{-CO-CH}_2\text{-E}$ are compounds of formula:

Preferred compounds of formula $R^2\text{-CHX}^1\text{X}^2$ are compounds of formula:

wherein X^3 represents halo, and n is 0 or 1-5. Preferably X^3 is chloro or fluoro, alkyl, preferably methyl, or alkoxy, preferably methoxy. Most preferably n is 1, and X^3 is present at the 4-position. Especially preferred is 4-fluorobenzaldehyde.

Preferred compounds of formula $R^3R^4\text{-N-C(=NH)NH}_2$ are guanidine, methylguanidine and N-methyl-N-mesylguanidine. The compounds of formula $R^3R^4\text{-N-C(=NH)NH}_2$ can be employed as the free base, but in many embodiments are advantageously employed as a salt, especially a hydrochloride salt.

Catalysts which can be employed in the present invention include bases and acids.

Bases which can be employed in the process of the present invention are preferably inorganic bases. Examples of inorganic base include alkali and alkaline earth

metal carbonates and hydrogencarbonates, particularly sodium or potassium carbonate and most preferably sodium or potassium hydrogencarbonate.

Acids which can be employed in the process of the present invention include both protic and Lewis acids. Examples of protic acids include mineral acids, such as hydrochloric, nitric and sulphuric acids and polyphosphate ester, or organic acids such as p-toluenesulfinic acid. Examples of suitable Lewis acids include FeCl_3 , NiCl_2 , boron trifluoride etherate and InCl_3 . When a Lewis acid is employed, a protic acid such as HCl , may also advantageously be present.

Step a) of the process according to the present invention preferably employs a solvent which is inert under the reaction conditions employed. In many embodiments, a polar solvent is employed, preferably a polar aprotic solvent, for example including dichloromethane, dimethylsulphoxide and tetrahydrofuran. Preferred solvents are amides, such as N-methylpyrrolidinone and especially dimethylformamide.

Step b) of the process preferably employs a solvent which is inert under the reaction conditions employed. The solvent is selected according to the nature of the oxidising agent employed, and may include the solvents described above for step a). Further solvents which may be employed in step b) include non-polar solvents, for example hydrocarbons, such as toluene.

Compounds of Formula (2) and tautomers thereof are novel, and accordingly form a second aspect of the present invention.

Step a) of the process according to the first aspect of present invention forms a third aspect of the present invention.

Step b) of the process according to the first aspect of present invention forms a fourth aspect of the present invention.

When it is desired to produce a compound of formula (1) wherein one or both of R^3 and R^4 is not H, it will be recognised that the alkyl, aryl or SO_2R^5 moieties, particularly methyl and mesyl moieties, may be present in the compound of formula $\text{R}^3\text{R}^4\text{N}-\text{O}(=\text{NH})\text{NH}_2$, may be introduced into a compound of formula (2) prepared where R^3 and R^4 are both H, prior to the oxidation in step b), or may be introduced into a compound of formula (2) prepared where R^3 and R^4 are both H.

The present invention is illustrated further, without limitation, by the following example.

Example

a) A 100 ml two neck round bottom flask equipped with a condenser and connected to a nitrogen line was charged with p-fluorobenzaldehyde (0.67ml, 5mmol), MIBA (0.78g, 5.5mmol), guanidine hydrochloride (1.18g, 12.5mmol), potassium carbonate (2.76g, 40mmol) and 10 ml of anhydrous dimethylformamide. This mixture was stirred and

heated at 70°C for 20h. The reaction mixture changed from colourless to yellow during this time. After cooling, dimethylformamide was removed under vacuum and the residue partitioned between brine (50ml) and ethyl acetate (200ml). The aqueous phase was washed with ethyl acetate (200ml) and the combined organic layers were dried over magnesium sulfate and filtered. The solvent was removed under vacuum to obtain 1g of yellow solid. ¹HNMR and LC showed methyl 2-amino-6-(4-fluorophenyl)-4-isopropyl-3,4-dihydropyrimidine-5-carboxylate as the major component (82%). This sample was characterised by comparison with a previously prepared standard.

b) A 25 ml three neck round bottom flask evacuated and back-filled with nitrogen was charged with methyl 2-amino-6-(4-fluorophenyl)-4-isopropyl-1,4-dihydropyrimidine-5-carboxylate (100 mg) and 15 ml of anhydrous THF. 2,3-Dichloro-5,6-dicyano-1,4-benzoquinone (135 mg, 0.45 mmol) was added under nitrogen. The red solution was stirred at room temperature. After 40 min, methyl 2-amino-6-(4-fluorophenyl)-4-isopropylpyrimidine-5-carboxylate was observed by HPLC and LC-MS. The product was identified by comparison with a standard of high purity prepared by a different chemical route. Both samples co-eluted by HPLC and showed the same ions by positive and negative electrospray mass spectrometry.

CLAIMS

1. A process for the preparation of a compound of Formula (1):

Formula (1)

which comprises

- a) reacting a compound of formula $R^1-CO-CH_2-E$ with a compound of formula $R^2-CHX^1X^2$ in the presence of a compound of formula $R^3R^4N-C(=NH)NH_2$ and a catalyst, thereby to form a dihydropyrimidine; and
 - b) oxidising the dihydropyrimidine produced in step a) to form the compound of Formula (1) wherein
- R^1 is H or an alkyl group;
 - R^2 is H or an alkyl or aryl group;
 - R^3 and R^4 are each independently H, alkyl, aryl, a group of formula R^5SO_2 , wherein R^5 is alkyl or aryl, or R^3 and R^4 are linked to form, together with the nitrogen to which they are attached to form a 5 to 7 membered heterocyclic ring;
 - E is an electron withdrawing group; and
 - X^1 and X^2 are each independently leaving groups, or X^1 and X^2 together represent =O.

2. A process according to claim 1, wherein the dihydropyrimidine is represented by the Formula (2), and tautomers thereof:

Formula (2)

3. A process according to claim 1 or claim 2, wherein the compound of formula $R^1-CO-CH_2-E$ is a compound of formula:

4. A process according to any preceding claim, wherein the compound of formula $R^2-CHX^1X^1$ is a compound of formula:

5

wherein X represents halo, and n is 0 or 1-5, and preferably 4-fluorobenzaldehyde.

10

5. A process according to any preceding claim, wherein the compound of formula $R^3R^4N-C(=NH)NH_2$ is guanidine, methylguanidine or N-methyl-N-mesylguanidine.

6. A process according to claim 5, wherein the compound of formula $R^3R^4N-C(=NH)NH_2$ is employed as a hydrochloride salt.

15

7. A process according to any preceding claim, wherein the catalyst is a base, preferably an alkali or alkaline earth metal carbonate and hydrogencarbonate.

20

8. A process according to any preceding claim, wherein the oxidising agent is a quinone.

9. A compound of Formula (2), and tautomers thereof:

Formula (2)

25

wherein

R^1 is H or an alkyl group;

R^2 is an H or an alkyl or aryl group;

30

R^3 and R^4 are each independently H, alkyl, aryl, a group of formula R^5SO_2 , wherein R^5 is alkyl or aryl, or R^3 and R^4 are linked to form, together with the nitrogen to which they are attached to form a 5 to 7 membered heterocyclic ring; and
E is an electron withdrawing group.

- *c1nc(*)c(*)n1N(*)*

10

15

- wherein,

R² is an H or an alkyl or aryl group;

20

X^1 and X^2 are each independently leaving groups, or X^1 and X^2 together represent =O.

- 25

- 30

Formula (1)

- 5 which comprises oxidising a compound of Formula (2) as claimed in claim 9, wherein
R¹ is H or an alkyl group;
R² is an H, an alkyl or aryl group;
R³ and R⁴ are each independently H, alkyl, aryl, a group of formula R⁵SO₂, wherein R⁵ is
10 alkyl or aryl, or R³ and R⁴ are linked to form, together with the nitrogen to which they are
attached to form a 5 to 7 membered heterocyclic ring; and
E is an electron withdrawing group.
16. A process according to claim 15, wherein R¹ represents isopropyl, R² represents 4-
15 fluorophenyl, and R³ and R⁴ each independently represents H, methyl or mesyl.
17. A process according to claim 15 or 16, wherein the oxidation employs a quinone.

ABSTRACT COMPOUNDS AND PROCESS

A process for the preparation of a compound of Formula

and intermediates useful therein are provided. The process comprises reacting a compound of formula $R^1\text{-CO-CH}_2\text{-E}$ with a compound of formula $R^2\text{-CHX}^1\text{X}^2$ in the presence of a compound of formula $R^3R^4\text{-N-C(=NH)NH}_2$ and a catalyst, thereby to form a dihydropyrimidine; and oxidizing the dihydropyrimidine to form the compound of Formula (I). R^1 is H or an alkyl group; R^2 is H, an alkyl or aryl group; R^3 and R^4 are each independently H, alkyl, aryl, a group of formula $R^5\text{SO}_2$, wherein R^5 is alkyl or aryl, or R^3 and R^4 are linked to form, together with the nitrogen to which they are attached to form a 5 to 7 membered heterocyclic ring; E is an electron withdrawing group; and X^1 and X^2 are each independently leaving groups, or X^1 and X^2 together represent =O.
